KNX VOC/TH-UP Touch
Combined indoor sensor

Item numbers 70970 (pure white), 70973 (black)

elsner

Manual

Elsner Elektronik GmbH • Sohlengrund 16 • 75395 Ostelsheim • Germany
Sensor KNX VOC/TH-UP Touch • from ETS programme version 1.0
Status: 15.02.2024 • Technical changes and errors excepted.

Elsner Elektronik GmbH • Sohlengrund 16 • 75395 Ostelsheim • Germany
Sensor KNX VOC/TH-UP Touch • from ETS programme version 1.0
Status: 15.02.2024 • Technical changes and errors excepted.

This manual is amended periodically and will be brought into line with new software releases. The change status (software version and date) can be found in the contents footer. If you have a device with a later software version, please check **www.elsner-elektronik.de** in the menu area "Service" to find out whether a more up-to-date version of the manual is available.

Clarification of signs used in this manual

⚠	Safety advice.
⚡	Safety advice for working on electrical connections, components, etc.
DANGER!	... indicates an immediately hazardous situation which will lead to death or severe injuries if it is not avoided.
WARNING!	... indicates a potentially hazardous situation which may lead to death or severe injuries if it is not avoided.
CAUTION!	... indicates a potentially hazardous situation which may lead to trivial or minor injuries if it is not avoided.
🛑 **ATTENTION!**	... indicates a situation which may lead to damage to property if it is not avoided.
ETS	In the ETS tables, the parameter default settings are marked by underlining.

1.   Safety and operating instructions

Installation, testing, operational start-up and troubleshooting should only be performed by a qualified electrician.

⚠ CAUTION!
Live voltage!

• Inspect the device for damage before installation. Only put undamaged devices into operation.
• Comply with the locally applicable directives, regulations and provisions for electrical installation.
• Immediately take the device or system out of service and secure it against unintentional switch-on if risk-free operation is no longer guaranteed.

Use the device exclusively for building automation and observe the operating instructions. Improper use, modifications to the device or failure to observe the operating instructions will invalidate any warranty or guarantee claims.

Operate the device only as a fixed-site installation, i.e. only in assembled condition and after conclusion of all installation and operational start-up tasks, and only in the surroundings designated for it.

Elsner Elektronik is not liable for any changes in norms and standards which may occur after publication of these operating instructions.

For information on installation, maintenance, disposal, scope of delivery and technical data, please refer to the installation instructions.

2.   Description

The **Sensor KNX VOC/TH-UP Touch** measures volatile organic compounds in the room air, temperature and humidity and calculates the dew point. The sensor can receive external measured values via the bus and process them with the own data to overall values (mixed values, e. g. room average). The **KNX VOC/TH-UP Touch** offers two push buttons that may be used for changing the ambient temperature (target value), for switching between operating modes or as free programmable bus push buttons.

The **KNX VOC/TH-UP Touch** provides switching outputs with adjustable threshold values. The switching outputs and further communication objects can be linked by AND and OR logic gates. Additionally, an integrated actuating variable comparator can compare and output values that are received via communication objects.

Integrated PI controllers allows for control of a ventilation (depending on VOC concentration and air humidity) and a heating/cooling system (depending on temperature). The **KNX VOC/TH-UP Touch** can emit a warning to the bus as soon as the area of optimum comfort (according to DIN 1946) is left.

The integrated display shows the own values and data received from the bus (e.g. date, time). The device is completed with a frame of the switching series installed in the building and thus merges with the interior.

Functions:

*   Measurement of **VOC** (volatile organic compounds) in the air. In this process, an air quality value in CO_2 equivalents is calculated via an algorithm from the sum signal of all compounds included in the mixed gas.
*   Measurement of **temperature** and **air humidity** (absolute and relative), calculation of the dew point
*   **Mixed values** from own measured values and external values (proportions can be set in percentage)
*   **Display** 1-3 rows (own values or values received from the bus) or display of temperature control (see *Mode display and manual temperature controller*)
*   **2 push buttons**. Configuration as bus push button or for changing ambient temperature and switching between operating modes (see *Change ambient temperature with the buttons*)
*   **PI controller for heating** (one or two step) and **cooling** (one or two step) depending on temperature. Control according to separate target values or basic target temperature
*   **PI controller for ventilation** depending on humidity and VOC concentration: dehumidification/humidification (one step) or dehumidification (one or two step)
*   **Threshold values** can be adjusted per parameter or via communication objects: 3 × temperature, 2 × humidity, 4 × VOC
*   **4 AND and 4 OR logic gates** with each 4 inputs. Every switching incident as well as 16 logic inputs in the form of communication objects, may be used as inputs for the logic gates. The output of each gate may optionally be configured as 1 bit or 2 x 8 bits
*   **2 actuating variable comparators** for output of minimum, maximum or average values. Each with 5 inputs (for values received via communication objects)

2.0.1. Measuring ranges of different gases (CO2 equivalents)

Corresponding VOC concentrations for specific representatives

Compound	Formula	Range* (ppm)	Potential sources of pollutants indoors
Carbon monoxide	CO	0-10	Car exhaust, fuel-based heating, cooking appliances, smoking
Methane	CH_4	0-200	Natural gas
Propane	C_3H_8	0-20	Fuel-based heating, cooking appliances, cleaners
Ethyl alcohol	C_2H_6O	0-3	Cosmetics, cleaners, disinfectants, detergents, paints, coatings, breath

Compound	Formula	Range* (ppm)	Potential sources of pollutants indoors
Acetaldehyde	C_2H_4O	0-20	Adhesives, coatings, plastics, lubricants, ripening of fruits
Methylethylketone	C_4H_8O	0-20	Adhesives, coatings, plastics, lubricants
Toluene	C_7H_8	0-5	Paints, coatings, cleaners, detergents, smoking, polyurethane lacquers

* corresponding concentration range based on lab measurements at gas mixing system with synthetic air at 50% r.h. and RT

3. Commissioning

Configuration is made using the KNX software as of ETS 5. The **product file** can be downloaded from the ETS online catalogue and the Elsner Elektronik website on **www.elsner-elektronik.de**.

After the bus voltage has been applied, the device will enter an initialisation phase lasting a few seconds. During this phase no information can be received or sent via the bus.

3.1. Addressing the equipment

The equipment is delivered with the bus address 15.15.255. Another address can be programmed using the ETS.

The programming button can be reached through the opening on the rear of the housing; it is recessed. Use a thin object to reach the button, e.g. a 1.5 mm² wire.

4. Display and operation at the device

Detailed specifications for the display and the use of the push buttons are set in the ETS.

Basically the display can show a two-row or three-row text (e. g. for measured values) or a temperature controller. You can switch between the two types by pressing one of the buttons, if this has not been disabled in the ETS.

4.1. Mode display and manual temperature controller

Depending on the ETS setting selected, the mode display will only display show the current target value, or the base target value setting with scale display. The manually adjustable range can be set in the ETS.

The following display options are available:
Fig. 1
Mode display with current target value and/or base target value
Fig. 2
Mode display with scale display for adjusting the base target value.
The control position in the image reads "Base target value reduced".
Fig. 3
Mode display with scale display and number.
Shows the set target value change.
The control position in the image reads "Base target value reduced to 1.0°".
Fig. 4
Mode display with scale display and range.
Shows the possible adjustment range (as set in the ETS).
The control position in the image reads "Base target value reduced".
Fig. 5
Mode display with scale display, range and number.
Displays the possible adjustment range (as set in the ETS) and the set target value change.
The control position in the image reads "Base target value reduced to 1.0°".

Symbols

⌂	Comfort mode. Comfort (present) target temperature will be used.	⌂	Standby mode. Standby (absent during day) target temperature will be used.
☾	Eco mode. Night target temperature will be used.	⌂	Building protection mode. Building protection target temperature will be used. The symbol will blink when the mode has been activated but the activation delay has not yet expired.
⌇⌇⌇	Heating mode. Heating will be provided.	❄	Cooling mode Cooling will be provided.

Priority (points)
Fig. 6
In "HVAC mode with 2x 8 bits" control mode, points are shown under the symbol, to indicate the running priority of the current mode.

One point: Priority 1/priority control. It is not possible to adjust the temperature automation system manually. Neither the target temperature nor the operating modes can be changed using the buttons on the unit.

Two points: Priority 2. The target temperature and operating mode can be changed using the buttons.

4.2. Change ambient temperature with the buttons

If the mode display is active, the target ambient temperature and the operating mode can be changed manually using the buttons. The button functions can be blocked in the ETS or be suppressed for Priority 1 operating modes. The individual operating modes can also be locked for manual selection in the ETS.

Decrease target temperature (-)	briefly press left button	Ambient temperature in the current mode is decreased. The sep-size is defined in the ETS (0.1°C to 5°C).
Increase target temperature (+)	briefly press right button	Ambient temperature in the current mode is increased. The sep-size is defined in the ETS (0.1°C to 5°C).

Change mode	press left or right button longer than 2 secs.	Changes between the operating modes Comfort, Standby, Eco and Building Protection (if deblocked in the ETS).
Extend Comfort mode	in Eco mode: press both buttons at the same time longer than 2 secs.	Switches from Eco to Comfort mode again for a certain time (e. g. if the rooms are used longer in the evening). The period is defined in the ETS (up to 10 hours). The time remaining in Comfort mode is displayed.

5. Transfer protocol

Units:

Temperatures in degrees Celsius
Air humidity in %
Absolute air humidity in g/kg and/or g/m^3
VOC content in ppm
Variables in %

5.1. List of all communications objects

Abbreviation flags:

C *Communication*
R *Read*
W *Write*
T *Transfer*
U *Update*

6. Parameter setting

6.1. Behaviour on power failure/ restoration of power

Behaviour following a failure of the bus power supply:

The device sends nothing.

Behaviour on bus restoration of power and following programming or reset:

The device sends all outputs according to their send behaviour set in the parameters. Delays established in the "General settings" parameter block are taken into account.

6.2. General settings

Set the basic data transfer characteristics and select whether or not malfunction objects should be sent.

Send delay after power-up and programming for:	
Measured values	<u>5 s</u> • ... • 2 h
Threshold values and switching outputs	<u>5 s</u> • ... • 2 h
Controller objects	5 s • <u>10 s</u> • ... • 2 h
Logic outputs	5 s • <u>10 s</u> • ... • 2 h
Maximum telegram quota	• 1 message per second • ... • <u>5 messages per second</u> • ... • 20 messages per second

Activate the malfunction objects for temperature/humidity or VOC to receive information on the bus if something is wrong with the measurement.

Use temp./humidity malfunction object	Yes • <u>No</u>
Use VOC malfunction object	Yes • <u>No</u>

6.3. Temperature value

When **measuring temperature**, the self-heating of the device is considered by the electronics. The heating is compensated for in the device.

Use **Offsets** to adjust the readings to be sent.
Permanent measurement variations can be corrected in this way.

Offset in 0,1°C	-50…50; 0

The unit can calculate a **mixed value** from its own reading and an external value. Set the mixed value calculation if desired. If an external value is used, all of the following settings are referred to the total value.

Use external reading	Yes • No
Ext. Reading proportion of the total reading	5% • 10% • ... • 50% • ... • 100%
All of the following settings are referred to the total value.	
Send internal and total reading	• never • periodically • on change • on change and periodically
From change of *(if sent on change)*	0,1°C • 0,2°C • 0,5°C • ... • 5,0°C
Send cycle *(if sent periodically)*	5 s • 10 s • ... • 2 h

The **minimum and maximum readings** can be saved and sent to the bus. Use the „Reset temperature min/max. value" objects to reset the values to the current readings. The values are not retained after a reset.

Use minimum/maximum value	Yes • No

6.4.   Temperature threshold values

Activate the required temperature threshold values. The menus for setting the threshold values are displayed.

Use threshold value 1/2/3	Yes • No

6.4.1. Threshold value 1, 2, 3

Threshold value

Set, in which cases **threshold values** received via object are to be retained. The parameter is only taken into consideration if the setting via object is activated below. Please note that the setting "After power supply restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first communication (setting via objects is ignored).

Set the threshold value directly in the application program using parameters, or define them via the bus using a communication object.

Threshold value setting via parameter:

Set the threshold values and switching distance (hysteresis) directly.

Threshold value setting via	**Parameter** • Communication objects
Threshold value in 0.1°C	-300 … 800; 200

Threshold value setting via a communication object:

Define, how the threshold value is to be received from the bus. Basically, a new value can be received, or simply a command to increase or decrease.

During initial commissioning, a threshold value must be defined, which will be valid until the first communication with a new threshold value. For units which have already been taken into service, the last communicated threshold value can be used. Basically, a temperature range is given, in which the threshold value can be changed (object value limit).

A set threshold value will be retained until a new value or a change is transferred. The current value is saved, so that it is retained in the event of a power supply failure and will be available once the power supply is restored.

Threshold value setting via	Parameter • **Communication objects**
The value communicated last shall be maintained	• never • after power supply restoration • after power supply restoration and programming
Start threshold value in 0.1°C valid until first communication	-300 … 800; 200
Object value limit (min) in 0.1°C	-300…800
Object value limit (max) in 0.1°C	-300…800
Type of threshold value change	Absolute value • Increase/decrease
Increment *(upon increase/decrease change)*	0,1 °C • ... • 5°C, 1°C

Set the **switching distance** independent of the type of threshold value specification.

Switching distance in % of the threshold value	0 … 50; 20

Switching output

Set the behaviour of the switching output when a threshold value is exceeded/undercut. The output switching delay can be set using objects or directly as a parameter.

When the following conditions apply, the output is (TV = Threshold value) (SD = Switching distance)	• TV above = 1	TV - SD below = 0 • LV above = 0	TV - SD below = 1 • TV below = 1 |TV + SD above = 0 • TV below = 0 |TV + SD above = 1
Delays can be set via objects (in seconds)	No • Yes

Switching delay from 0 to 1 *(If delay can be set via objects: valid until 1st communication)*	<u>None</u> • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching delay from 1 to 0 *(If delay can be set via objects: valid until 1st communication)*	<u>None</u> • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching output sends	• <u>on change</u> • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Cycle *(only if sending periodically is selected)*	<u>5 s</u> • 10 s • 30 s... • 2 h

Block

The switching output can be blocked using an object.

Use switching output block	<u>No</u> • Yes

If the block is activated, define specifications here for the behaviour of the output when blocked.

Analysis of the blocking object	• <u>At value 1: block	At value 0: release</u> • At value 0: block	At value 1: release
Blocking object value before 1st communication	<u>0</u> • 1
Behaviour of the switching output	
On block	• <u>Do not send message</u> • send 0 • send 1
On release (with 2 seconds release delay)	[Dependent on the "Switching output sends" setting]

The behaviour of the switching output on release is dependent on the value of the parameter "Switching output sends" (see "Switching output")

Switching output sends on change	• Do not send message • Send switching output status
Switching output sends on change to 1	• Do not send message • if switching output = 1 ➔ send 1
Switching output sends on change to 0	• Do not send message • if switching output = 0 ➔ send 0
Switching output sends on change and periodically	Send switching output status
Switching output sends on change to 1 and periodically	if switching output = 1 ➔ send 1
Switching output sends on change to 0 and periodically	if switching output = 0 ➔ send 0

6.5.   Temperature PI control

Activate the control if you want to use it.

Use control	<u>No</u> • Yes

General control

Set, in which cases **setpoint values and extension time** received via object are to be retained. The parameter is only taken into consideration if the setting via object is activated below. Please note that the setting "After power supply restoration and pro-gramming" should not be used for the initial start-up, as the factory settings are always used until the 1st communication (setting via objects is ignored).
.

For an adequate regulation of the indoor temperature, comfort, standby, eco and building protection modes may be used.
Comfort when present,
Standby during short absences,
Eco as a night-time mode and
Frost/heat protection (building protection) during longer absences.

The settings for the temperature control include the set point temperatures for the individual modes. Objects are used to determine which mode is to be selected. A change of mode may be triggered manually or automatically (e.g. by a timer, window contact).

The **mode** may be switched with two 8 bit objects of different priority. Objects
„... HVAC mode (Prio 2)" for switching in everyday operation and
„... HVAC mode (Prio 1)" for central switching with higher priority.
The objects are coded as follows:
0 = Auto
1 = Comfort
2 = Standby
3 = Eco
4 = Building Protection

Alternatively, you can use three objects, with one object switching between eco and standby mode and the two others activating comfort mode and frost/heat protection mode respectively. The comfort object blocks the eco/standby object, and the frost/heat protection object has the highest priority. Objects
„... Mode (1: Eco, 0: Standby)",
„... comfort activation mode" and
„... frost/heat protection activation mode"

Switch mode via	• two 8 Bit objects (HVAC Modes)
	• three 1 bit objects

Select the **mode to be activated after reset** (e.g. power failure, reset of the line via the bus) (Default).
Then configure a temperature control **block** via the blocking object.

Mode after reset	• Comfort • Standby • Eco • Building protection
Behaviour of the blocking object with value	• 1 = Block | 0 = release • 0 = block | 1 = release
Blocking object value before 1st communication	0 • 1

Specify when the current **control variables** of the controller are to be **sent** to the bus. Periodic sending is safer, in case a message does not reach a recipient. You may also set up periodical monitoring by the actuator with this setting.

Send control variable	• on change • on change and periodically
from change (in % absolute)	1...10; 2
Cycle *(if sent periodically)*	5 s • ... • 5 min • ... • 2 h

The **status object** reports the current status of the control variables (0% = OFF, >0% = ON) and may for example be used for visualisation, or to switch off the heating pump as soon as the heating is switched off.

Send status objects	• on change • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Cycle *(if sent periodically)*	5 s • ... • 5 min • ... • 2 h

Then define the **type of control**. Heating and/or cooling may be controlled in two levels.

Type of control	• Single level heating • Dual-level heating • Single-level cooling • Single-level heating + single-level cooling • Dual-level heating + single-level cooling • Dual-level heating + dual-level cooling

General set point values

You may enter separate setpoint values for each mode or use the comfort setpoint as a basic value.

If you are using the control for both heating *and* cooling, you may also select the setting "separately with switching object". Systems used for cooling in summer and for heating in winter can thus be switched from one to the other.

If no switching object is selected, the actual temperature determines whether heating or cooling takes place. If the actual value is between the heating and cooling setpoint values, the existing operating mode is retained. If heating was previously used, the system remains in heating mode and continues to aim for this set point value. Only when the cooling setpoint is reached does the operating mode switch to cooling.

If cooling has been used so far, the system remains in cooling mode and continues to aim for this set point value. Only when the heating setpoint is reached does the operating mode switch to heating.

If the actual temperature is above the cooling set point value, cooling takes place; if it is below the heating set point value, heating takes place. The difference between the heating set point value and the cooling set point value or the dead zone should be at least 1 °C. This prevents the control from switching too often between heating and cooling in the event of minor temperature fluctuations.

If you are using the basic value, only the deviation from the comfort setpoint value is listed for the other modes (e.g, 2°C less for standby mode).

Preserve modified set points after mode change	No • <u>Yes</u>
Setting the nominal values	• <u>separate with switching object</u> • separate without switching object • with comfort set point as a basis with switching object • with comfort set point as a basis without switching object
Behaviour of the switching object at value *only if switching object is used*	• <u>0 = Heating | 1 = Cooling</u> • 1 = Heating | 0 = Cooling
Switching object value before 1st communication *only if switching object is used*	<u>0</u> • 1

The grades for the set point changes is predefined. Modifications may only remain active temporarily (do not save) or remain saved even after voltage recovery (and programming). This also applies to a comfort extension.

Grading for set point changes (in 0.1 °C)	1… 50; <u>10</u>
Saving set point value(s)	• not • <u>after voltage recovery</u> • after voltage recovery and programming

The control may be manually reset to comfort mode from eco, or night mode. This allows the user to maintain the daily nominal value for a longer time, e.g. when having guests. The duration of this comfort extension period is set. After the comfort extension period is terminated, the system returns to eco mode.

Comfort extension time in seconds (can only be activated from eco mode)	1…36000; <u>3600</u>

Set point Comfort

Comfort mode is usually used for daytime mode when people are present. A starting value is defined for the comfort set point as well as a temperature range in which the nominal value may be modified.

Initial heating/cooling set point (in 0.1 °C) valid till 1st communication *not upon saving the set point value after programming*	-300...800; <u>210</u>

If set point values are entered separately:

Min. object value heating/cooling (in 0.1 °C)	-300...800; <u>160</u>
Max. object value heating/cooling (in 0.1 °C)	-300...800; <u>280</u>

If the comfort setpoint value is used as a basis:

If the comfort setpoint value is used as a basis, the reduction/increment of the value is set.

Starting heating/cooling setpoint (in 0.1 °C) valid until 1st communication	-300...800; <u>210</u>
Minimum base setpoint (in 0.1°C)	-300...800; <u>160</u>
Maximum base setpoint (in 0.1°C)	-300...800; <u>280</u>
Reduction by up to (in 0.1°C)	1...100; <u>50</u>
Increase by up to (in 0.1°C)	1...100; <u>50</u>

If the comfort setpoint is used as the basis without a switching object, a dead zone is specified for the control mode "heating *and* cooling" to avoid direct switching from heating to cooling.

Dead zone between heating and cooling in 0,1°C *(only if both heating AND cooling are used)*	1...100; <u>50</u>

Standby setpoint

Standby mode is usually used for daytime mode when people are absent.

If setpoint values are entered separately:

A starting setpoint value is defined as well as a temperature range in which the setpoint value may be changed.

Starting heating setpoint (in 0.1 °C) valid until 1st communication	-300...800; <u>180</u>
Starting heating setpoint (in 0.1 °C) valid until 1st communication	-300...800; <u>240</u>

Min. object value heating/cooling (in 0.1 °C)	-300…800; <u>160</u>
Max. object value heating/cooling (in 0.1 °C)	-300…800; <u>280</u>

If the comfort setpoint value is used as a basis:

If the comfort setpoint value is used as a basis, the reduction/increment of the value is set.

Reduce heating setpoint (in 0.1°C) *(for heating)*	0…200; <u>30</u>
Increase cooling setpoint (in 0.1°C) *(for cooling)*	0…200; <u>30</u>

Eco setpoint

Eco mode is usually used for night mode.

If setpoint values are entered separately:

A starting setpoint value is defined as well as a temperature range in which the setpoint value may be changed.

Starting heating setpoint (in 0.1 °C) valid until 1st communication	-300…800; <u>160</u>
Starting cooling setpoint (in 0.1 °C) valid until 1st communication	-300…800; <u>280</u>
Min. object value heating/cooling (in 0.1 °C)	-300…800; <u>160</u>
Max. object value heating/cooling (in 0.1 °C)	-300…800; <u>280</u>

If the comfort setpoint value is used as a basis:

If the comfort setpoint value is used as a basis, the reduction/increment of the value is set.

Reduce heating setpoint (in 0.1°C) *(for heating)*	0…200; <u>50</u>
Increase cooling setpoint (in 0.1°C) *(for cooling)*	0…200; <u>60</u>

Setpoint values for frost/heat protection (building protection)

The building protection mode is for example used as long as windows are opened for ventilation. Setpoints for frost protection (heating) and heat protection (cooling) are determined which may not be modified from outside (no access via operating devices etc.). The building protection mode may be activated with delay, which allows you to leave the building before the controls switch to frost/heat protection mode.

Setpoint frost protection (in 0.1°C)	-300…800; <u>70</u>
Activation delay	none • 5 s • … • <u>5 min</u> • … • 2 h

Setpoint heat protection (in 0.1°C)	-300…800; <u>350</u>
Activation delay	none • 5 s • ... • <u>5 min</u> • ... • 2 h

General control variables

This setting appears for the control types "Heating *and* Cooling" only. Here, you can decide whether to use a common control variable for heating and cooling. If the 2nd level has a common control variable, you also determine the control mode of the 2nd level here.

For heating and cooling	• <u>separate control variables are used</u> • common control variables are used for Level 1 • common control variables are used for Level 2 • common control variable are used for Level 1+2
Use control variable for 4/6-way valve *(only for common control variables in level 1)*	<u>No</u> • Yes
Control type *(for level 2 only)*	• 2-point-control • PI control
Control variable of the 2nd Level is on *(only for level 2 with 2 point controlling)*	• <u>1 bit object</u> • 8 bit object

When using the control variable for a 4/6 way valve, the following applies:
0%...100% heating = 66%...100% control variable
OFF = 50% control variable
0%...100% cooling = 33%...0% control variable

6.5.1. Heating control level 1/2

If a heating control mode is configured, one or two setting sections for the heating levels are displayed.

In the 1st level, heating is controlled by a PI control, which allows to either enter control parameters or select predetermined applications.

In the 2nd level (therefore only in case of 2-level heating), heating is controlled via a PI or a 2-point-control.
In level 2, the setpoint difference between the two levels must also be specified, i.e. below which setpoint deviation the second level is added.

Setpoint difference between 1st and 2nd level (in 0.1°C) *(for level 2)*	0...100; <u>40</u>
Control type *(for level 2, no common control variables)*	• 2-point-control • PI control

Control variable is a *(for level 2 with 2-point controlling, no common control variables)*	• <u>1 bit object</u> • 8 bit object

PI control with control parameters:

This setting allows individual input of the parameters for PI control.

Control type	• **PI control**
Setting of the controller by	• **Controller parameter** • specified applications

Specify the deviation from the setpoint value at which the maximum control variable value is reached, i.e. the point at which maximum heating power is activated.

The reset time shows how quickly the controller responds to deviations from the setpoint value. In case of a short reset time, the control responds with a fast increase of the control variable. In case of a long reset time, the control responds somewhat less urgently and needs longer until the necessary control variable for the setpoint value deviation is reached.

You should set the time appropriate to the heating system at this point (observe manufacturer's instructions).

Maximum control variable is reached at setpoint/actual difference of (in °C)	1...<u>5</u>
Reset time (in min.)	1...255; <u>30</u>

Now specify what should be sent when the control is blocked. Set a value greater 0 (=OFF) to receive a basic heating level, e.g. for floor heating.

On release, the control variable follows the rule again.

When blocked, the control variable shall	• <u>not be sent</u> • send a specific value
Value (in %) *(if a value is sent)*	<u>0</u>...100

In case of a common control variable for heating and cooling, 0 is always transmitted as a fixed value.

PI control with predetermined application:

This setting provides fixed parameters for frequent applications.

Control type	• **PI control**
Setting of the controller by	• Controller parameter • **specified applications**
Application	• Warm water heating • Floor heating • Convection unit • Electric heating
Maximum control variable is reached at setpoint/actual difference of (in °C)	Warm water heating: 5 Floor heating: 5 Convection unit: 4 Electric heating: 4

Reset time (in min.)	Warm water heating: 150 Floor heating: 240 Convection unit: 90 Electric heating: 100

Now specify what should be sent when the control is blocked. Set a value greater 0 (=OFF) to receive a basic heating level, e.g. for floor heating.
On release, the control variable follows the rule again.

When blocked, the control variable shall	• not be sent • send a specific value
Value (in %) *(if a value is sent)*	0...100

In case of a common control variable for heating and cooling, 0 is always transmitted as a fixed value.

2-point-control (only level 2):

2-point-control is used for systems which are only set to ON or OFF.

Control type *(is determined at a higher level for common control variables)*	• **2-point-control**

Enter the switching distance that prevents frequent on/off switching of temperatures in the threshold range.

Switching distance (in 0.1°C)	0...100; 20

If separate control variables are used, select whether the control variable of the 2nd level is a 1 bit object (on/off) or an 8 bit object (on with percentage/off).

Control variable is a	• 1 bit object • 8 bit object
Value (in %) *(for 8 bit object)*	0...100

Now specify what should be sent when the control is blocked. Set a value greater 0 (=OFF) to receive a basic heating level, e.g. for floor heating. On release, the control variable follows the rule again.

When blocked, the control variable shall	• not be sent • send a specific value
Value (in %) *only if a value is sent*	0...100

6.5.2. Cooling control level 1/2

If a cooling control mode is configured, one or two setting sections for the cooling levels are displayed.

In the 1st level, cooling is controlled by a PI control in which either control parameters can be entered or predetermined applications can be selected.

In the 2nd level (therefore only for 2-level cooling), cooling is controlled via a PI or a 2-point-control.

In level 2, the setpoint deviation between the two levels must also be specified, i.e. above which setpoint value deviation the second level is added.

Setpoint difference between 1st and 2nd level (in 0.1°C) *(for level 2)*	0...100; <u>40</u>
Control type *(for level 2, no common control variables)*	• 2-point-control • PI control
Control variable is a *(for level 2 with 2-point controlling, no common control variables)*	• <u>1 bit object</u> • 8 bit object

PI control with control parameters:

This setting allows individual input of the parameters for PI control.

Control type	• **PI control**
Setting of the controller by	• **Controller parameter** • specified applications

Specify the deviation from the setpoint value which reaches maximum variable value, i.e. the point at which maximum cooling power is activated.

The reset time shows how quickly the controller responds to deviations from the setpoint value. In case of a short reset time, the control responds with a fast increase of the control variable. In case of a long reset time, the control responds somewhat less urgently and needs longer until the necessary control variable for the setpoint value deviation is reached. You should set the time appropriate to the cooling system at this point (observe manufacturer's instructions).

Maximum control variable is reached at setpoint/actual difference of (in °C)	1...<u>5</u>
Reset time (in min.)	1...255; <u>30</u>

Now specify what should be sent when the control is blocked.
On release, the control variable follows the rule again.

When blocked, the control variable shall	• <u>not be sent</u> • send a specific value
Value (in %) *(if a value is sent)*	<u>0</u>...100

In case of a common control variable for heating and cooling, 0 is always transmitted as a fixed value.

PI control with predetermined application:

This setting provides fixed parameters for a cooling ceiling

Control type	• **PI control**
Setting of the controller by	• Controller parameter • **specified applications**

Application	• Cooling ceiling
Maximum control variable is reached at setpoint/actual difference of (in °C)	Cooling ceiling: 5
Reset time (in min.)	Cooling ceiling: 30

Now specify what should be sent when the control is blocked.
On release, the control variable follows the rule again.

When blocked, the control variable shall	• not be sent • send a specific value
Value (in %) *(if a value is sent)*	0...100

2-point-control (only level 2):

2-point-control is used for systems which are only set to ON or OFF.

Control type *is determined at a higher level for common variables*	• **2-point-control**

Enter the switching distance that prevents frequent on/off switching of temperatures in the threshold range.

Switching distance (in 0.1°C)	0...100; 20

If separate control variables are used, select whether the control variable of the 2nd level is a 1 bit object (on/off) or an 8 bit object (on with percentage/off).

Control variable is a	• 1 bit object • 8 bit object
Value (in %) *(for 8 bit object)*	0...100

Now specify what should be sent when the control is blocked.
On release, the control variable follows the rule again.

When blocked, the control variable shall	• not be sent • send a specific value
Value (in %) *(if a value is sent)*	0...100

In case of a common control variable for heating and cooling, 0 is always transmitted as a fixed value.

6.6. Humidity measurement

Use **Offsets** to adjust the readings to be sent.

Offset in % RH	-10...10; 0

The unit can calculate a **mixed value** from its own reading and an external value. Set the mixed value calculation if desired. If an external portion is used, all of the following settings (threshold values, etc.) are related to the overall reading.

Use external measured value	<u>No</u> • Yes
Ext. Reading proportion of the total reading	5% • 10% • ... • <u>50%</u> • ... • 100%
All of the following settings are referred to the total value.	
Send internal and total reading	• <u>never</u> • periodically • on change • on change and periodically
At and above change of *(if sent on change)*	0.1% RH • 0.2% RH • 0.5% RH • <u>1.0% RH</u> • ... • 25% RH
Send cycle *(if sent periodically)*	<u>5 s</u> • 10 s • ... • 2 h

The **minimum and maximum readings** can be saved and sent to the bus. Use the „Reset humidity min/max value" object to reset the values to the current readings. The values are not retained after a reset.

Use minimum and maximum value	<u>No</u> • Yes

6.7.   Humidity threshold values

Activate the required air humidity threshold values. The menus for setting the threshold values are displayed.

Use threshold value 1/2	Yes • <u>No</u>

6.7.1.   Threshold value 1, 2

Threshold value

Set, in which cases **threshold values and delay times** received via objects are to be retained. The parameter is only taken into consideration if the setting via object is activated below. Please note that the setting "After power supply restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first communication (setting via objects is ignored).
Set the threshold value directly in the application program using parameters, or define them via the bus using a communication object.

Threshold value setting using parameter:

Set the threshold values and switching distance directly.

Threshold value setting using	**Parameter** • Communication objects
Threshold value in 0.1% RH (*valid until 1st communication*)	0 … 100; <u>70</u>

Threshold value setting using a communication object:

Define, how the threshold value is to be received from the bus. Basically, a new value can be received, or simply a command to increase or decrease.

During initial commissioning, a threshold value must be defined, which will be valid until the first communication with a new threshold value. For units which have already been taken into service, the last communicated threshold value can be used. Basically, a humidity range is specified in which the threshold value can be changed (object value limit).

A set threshold value will be retained until a new value or a change is transferred. The current value is saved, so that it is retained in the event of a power supply failure and will be available once the power supply is restored.

Threshold value setting using	Parameter • **Communication objects**
The value communicated last shall be maintained	• never • after power supply restoration • after power supply restoration and programming
Starting threshold value in 0.1% RH valid until first communication	0 … 100; 70
Object value limit (min.) in 0.1%RH	0…100
Object value limit (max.) in 0.1%RH	0…100
Type of threshold value change	Absolute value • Increase/Decrease
Increment *(upon increase/decrease change)*	1,00% • 2,00% • 5,00% • 10,00%

Set the **switching distance** independent of the type of threshold value specification.

Switching distance of the threshold value in % (relative to the threshold value)	0 … 50; 20

Switching output

Set the behaviour of the switching output when a threshold value is exceeded/under-cut. The output switching delay can be set using objects or directly as a parameter.

When the following conditions apply, the output is (TV = Threshold value) (SD = Switching distance)	• TV above = 1 | TV - SD below = 0 • LV above = 0 | TV - SD below = 1 • TV below = 1 |TV + SD above = 0 • TV below = 0 |TV + SD above = 1
Delays can be set via objects (in seconds)	No • Yes
Switching delay from 0 to 1 *(If delay can be set via objects: valid until 1st communication)*	None • 1 s • 2 s • 5 s • 10 s • ... • 2 h

Switching delay from 1 to 0 *(If delay can be set via objects: valid until 1st communication)*	None • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching output sends	• on change • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Cycle *(is only sent if periodically is selected)*	5 s • 10 s • 30 s... • 2 h

Block

The switching output can be blocked using an object.

Use switching output block	No • Yes

If the block is activated, define specifications here for the behaviour of the output when blocked.

Analysis of the blocking object	• At value 1: block | At value 0: release • At value 0: block | At value 1: release
Blocking object value before first communication	0 • 1
Behaviour of the switching output	
On block	• Do not send message • send 0 • send 1
On release (with 2 seconds release delay)	[Dependent on the "Switching output sends" setting]

The behaviour of the switching output on release is dependent on the value of the parameter "Switching output sends" (see "Switching output")

Switching output sends on change	• Do not send message • Send switching output status
Switching output sends on change to 1	• Do not send message • if switching output = 1 ➔ send 1
Switching output sends on change to 0	• Do not send message • if switching output = 0 ➔ send 0
Switching output sends on change and periodically	Send switching output status
Switching output sends on change to 1 and periodically	if switching output = 1 ➔ send 1
Switching output sends on change to 0 and periodically	if switching output = 0 ➔ send 0

6.8.　　Humidity PI control

If you activate humidity control, you can use the following settings to define control type, setpoint values, and humidification and dehumidification.

Use humidity control	<u>No</u> • Yes

General control

Sensor KNX VOC/TH-UP Touch can be used to control one- or two-level dehumidification or combined humidification/dehumidification.

Type of control	• <u>One-level dehumidification</u> • Two-level dehumidification • Humidification and dehumidification

Configure a block for the humidity control using the blocking object.

Behaviour of the blocking object with value	• <u>1 = block control | 0 = release control</u> • 0 = block control | 1 = release control
Blocking object value before first communication	<u>0</u> • 1

Specify when the current control variables are to be sent to the bus. Periodic sending is safer, in case a message does not reach a recipient. You may also set up periodic monitoring using an actuator with this setting.

Send control variable	• <u>on change</u> • on change and periodically
from change (in % absolute)	1 ... 20, <u>2</u>
Send cycle (*is only sent if "periodically" is selected*)	5 s • ... • <u>5 min</u> • ... • 2 h

The status object shows the current status of the output variable (0 = OFF, >0 = ON) and can for example be used for visualisation.

Send status object(s)	• <u>on change</u> • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Send cycle (*is only sent if "periodically" is selected*)	5 s • ... • <u>5 min</u> • ... • 2 h

Controller setpoint

Set, in which cases **setpoint values** received via object are to be retained. Please note that the setting "After power supply restoration and programming" should not be used

for the initial start-up, as the factory settings are always used until the first communication (setting via objects is ignored).

During initial commissioning, a **setpoint value** must be defined which is valid until the first communication of a new setpoint value. For units which have already been taken into service, the last communicated setpoint value can be used. Basically, an air humidity range is specified in which the setpoint value can be changed (**object value limit**).

Enter, how the setpoint value will be received from the bus. Basically, a new value can be received, or simply a command to increase or decrease.

A set setpoint value will be retained until a new value or a change is transferred. The current value is saved, so that it is retained in the event of a power supply failure and will be available once the power supply is restored.

Setpoint value setting using parameter:

Set the threshold values and switching distance directly.

Setpoint value setting using	**Parameter** • Communication objects
Setpoint value in 0.1% RH (valid until 1st communication)	0 … 100; <u>70</u>

Setpoint value setting using communication object:

Setpoint value setting using	Parameter • **Communication objects**
The value communicated last shall be maintained	• <u>never</u> • after power supply restoration • after power supply restoration and programming
Start setpoint in % valid until first communication *(not upon saving the setpoint value after programming)*	0 … 100; <u>50</u>
	0…100; <u>40</u>
Object value limit (min.) in %	0…100; <u>60</u>
Object value limit (max.) in %	<u>Absolutwert</u> • Anhebung / Absenkung
	1,00% • 2,00% • <u>5,00%</u> • 10,00%

In "Humidification and dehumidification" control mode, a dead zone is specified so that a direct changeover switching between humidification and dehumidification can be avoided.

Dead zone between humidification and dehumidification in % *(only if both humidification and dehumidification are used)*	0…50; <u>15</u>

Humidification starts, when the relative air humidity is lower or equal to the setpoint value - dead zone value.

Dehumidification and/or humidification

Depending on the control mode, settings sections for humidification and dehumidification appear (level 1/2).

For dual-level dehumidification, the setpoint value difference between the two levels must be defined, i.e. the setpoint value which, when exceeded, triggers the switch to the 2nd level.

Target value difference between level 1 and 2 in % *(for level 2 only)*	0...50; 15

Determine the deviation from the setpoint value at which the maximum variable value is reached, i.e. the point at which maximum output is used.
The reset time shows how quickly the controller responds to deviations from the setpoint value. In case of a short reset time, the control responds with a fast increase of the control variable. In case of a long reset time, the control responds somewhat less urgently and needs longer until the necessary control variable for the setpoint value deviation is reached.
You should set the time appropriate for the humidification/dehumidification system at this point (note manufacturer instructions).

Maximum control variable is reached at target/actual difference of %	1...50; 5
Reset time in minutes	1...255; 3

Now specify, what should be sent when the control is blocked.
On release, the control variable follows the rule again.

When blocked, the control variable shall	• not be sent • send a specific value
Value in % (*if a value is sent*)	0...100

6.9.   Dewpoint measurement

The **Sensor KNX VOC/TH-UP Touch** calculates the dewpoint temperature and can output the value to the bus.

Use dewpoint temperature	No • Yes
Sending pattern	• never • periodically • on change • on change and periodically
At and above change of *(if sent on change)*	0,1°C • 0,2°C • 0,5°C • 1,0°C • 2,0°C • 5,0°C
Send cycle *(if sent periodically)*	5 s • 10 s • 30 s • 1 min • ... • 2 h

Activate the monitoring of the coolant temperature if required. The menus for setting the monitoring are displayed.

Use monitoring of the coolant temperature	<u>No</u> • Yes

6.9.1.   Cooling medium temp. monitoring

A threshold value can be set for the temperature of the coolant, which is based on the current dewpoint temperature (offset/deviation). The switching output of the coolant temperature monitoring system can provide a warning prior to any build-up of condensation in the system, and/or activate appropriate countermeasures.

Threshold value

Threshold value = dewpoint temperature + offset

Set, in which cases **offset** received via object is to be retained. Please note that the setting "After power supply restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first communication (setting via objects is ignored).

The offset communicated last shall be maintained	• <u>never</u> • after power supply restoration • after power supply restoration and programming

During initial commissioning, an **offset** must be defined which is valid until the first communication of a new offset. For units which have already been taken into service, the last communicated offset can be used.

A set offset will be retained until a new value or a change is transferred. The current value is saved, so that it is retained in the event of a power supply failure and will be available once the power supply is restored.

Start offset in °C valid until first communication	0...20; <u>3</u>
Increment for offset change via communication object	0,1°C • 0,2°C • 0,3°C • 0,4°C • 0,5°C • <u>1°C</u> • 2°C • 3°C • 4°C • 5°C
Switching distance of the threshold value in % *(for setting in %)*	0 ... 50; <u>20</u>
Threshold value sends	• <u>never</u> • periodically • on change • on change and periodically
At and above change of *(if sent on change)*	<u>0.1°C</u> • 0.2°C • 0.5°C • 1.0°C • 2.0°C • 5.0°C
Send cycle *(if sent periodically)*	5 s • <u>10 s</u> • 30 s • 1 min • ... • 2 h

Switching output

The output switching delay can be set using objects or directly as a parameter.

When the following conditions apply, the output is (TV = Threshold value) (SD = Switching distance)	• TV above = 1 | TV - SD below = 0 • LV above = 0 | TV - SD below = 1 • <u>TV below = 1 |TV + SD above = 0</u> • TV below = 0 |TV + SD above = 1
Delays can be set via objects (in seconds)	<u>No</u> • Yes
Switching delay from 0 to 1 *for setting via objects:* *valid until 1st communication*	<u>None</u> • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching delay from 1 to 0 *for setting via objects:* *valid until 1st communication*	<u>None</u> • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching output sends	• <u>on change</u> • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Send cycle *(is only sent if periodically is selected)*	<u>5 s</u> • 10 s • 30 s... • 2 h

Blocking

The switching output can be blocked using an object. Define specifications here for the behaviour of the output when blocked.

Use switching output block	<u>No</u> • Yes
Analysis of the blocking object	• <u>At value 1: block | At value 0: release</u> • At value 0: block | At value 1: release
Blocking object value before first communication	<u>0</u> • 1
Behaviour of the switching output	
On block	• <u>Do not send message</u> • send 0 • send 1
On release (with 2 seconds release delay)	[Dependent on the "Switching output sends" setting]

The behaviour of the switching output on release is dependent on the value of the parameter "Switching output sends" (see "Switching output")

Switching output sends on change	• Do not send message • Send switching output status
Switching output sends on change to 1	• Do not send message • if switching output = 1 ➜ send 1
Switching output sends on change to 0	• Do not send message • if switching output = 0 ➜ send 0

Switching output sends on change and periodically	Send switching output status
Switching output sends on change to 1 and periodically	if switching output = 1 ➔ send 1
Switching output sends on change to 0 and periodically	if switching output = 0 ➔ send 0

6.10. Absolute humidity

The absolute air humidity value is detected by the **KNX VOC/TH-UP Touch** and can be output to the bus.

Use absolute humidity	No • Yes
Sending pattern	• never • periodically • on change • on change and periodically
At and above change of *(if sent on change)*	0,1 g • 0,2 g • 0,5 g • 1,0 g • 2,0 g • 5,0 g
Send cycle *(if sent periodically)*	5 s • 10 s • 30 s... • 2 h

6.11. Comfort field

The **Sensor KNX VOC/TH-UP Touch** can send a message to the bus if the limits of the comfort field are exceeded. In this way, it is for example possible to monitor compliance with DIN 1946 (standard values) or even to define your own comfort field.

Use comfort field	No • Yes
Sending pattern	• never • periodically • on change • on change and periodically
Send cycle *(if sent periodically)*	5 s • 10 s • 30 s... • 2 h

Define the comfort field by specifying the minimum and maximum values for temperature and humidity. The specified standard values comply with DIN 1946

Maximum temperature in °C (Standard 26°C)	25 ... 40; 26
Minimum temperature in °C (Standard 20°C)	10 ... 21; 20
Maximum relative humidity in % *(*Standard 65%)	52 ... 90; 65

| Minimum relative humidity in % (Standard 30%) | 10 ... 43; <u>30</u> |
| Maximum absolute humidity in 0.1 g/kg (Standard 115 g/kg) | 50 ... 200; <u>115</u> |

Temperature switching distance: 1°C
Relative humidity switching distance: 2% RH
Absolute humidity switching distance: 2 g/kg

6.12. VOC parameter settings

Use **Offsets** to adjust the readings to be sent.

| Offset in ppm | -100…100; <u>0</u> |

The unit can calculate a **mixed value** from its own reading and an external value. Set the mixed value calculation if desired. If an external portion is used, all of the following settings (threshold values, etc.) are related to the overall reading.

Use external measured value	<u>No</u> • Yes
Ext. Reading proportion of the total reading	5% • 10% • ... • <u>50%</u> • ... • 100%
All of the following settings are referred to the total value.	
Sending pattern for internal and total measured value	• <u>never</u> • periodically • on change • on change and periodically
At and above change of (relative to the last measured value) *(if sent on change)*	2% • <u>5%</u> • ... • 50%
Send cycle *(if sent periodically)*	<u>5 s</u> • 10 s • ... • 2 h

The **maximum reading** can be saved and sent to the bus. Using the "Reset VOC maximum value" objects, the value can be reset to the current reading. The value is not retained after a reset.

| Use maximum value | <u>No</u> • Yes |

6.13. VOC threshold values

Activate the required VOC threshold value. The menus for setting the threshold values are displayed.

| Use threshold value 1/2/3/4 | Yes • <u>No</u> |

 300 ppm ... 1000 ppm: fresh air
1000 ppm ... 2000 ppm: used air

1000 ppm = 0.1 %

6.13.1. Threshold value 1, 2, 3, 4

Threshold value

Set, in which cases **threshold values and delay times** received via object are to be retained. The parameter is only taken into consideration if the setting via object is activated below. Please note that the setting "After power supply restoration and programming" should not be used for the initial start-up, as the factory settings are always used until the first communication (setting via objects is ignored).

Set the threshold value directly in the application program using parameters, or define them via the bus using a communication object.

Threshold value setting using parameters:

Set the threshold values and switching distance directly.

Threshold value setting using	**Parameter** • Communication objects
Threshold value in ppm	0 … 5000; 1200

Threshold value setting using a communication object:

Define, how the threshold value will be received from the bus. Basically, a new value can be received, or simply a command to increase or decrease.

During initial commissioning, a threshold value must be defined, which will be valid until the first communication of a new threshold value. For units which have already been taken into service, the last communicated threshold value can be used. Basically, a range is specified in which the threshold value can be changed (object value limit).

A set threshold value will be retained until a new value or a change is transferred. The current value is saved, so that it is retained in the event of a power supply failure and will be available once the power supply is restored.

Threshold value setting using	Parameter • **Communication objects**
The value communicated last shall be maintained	• never • after power supply restoration • after power supply restoration and programming
Start threshold value in 0.1°C valid until first communication	0 … 5000; 1200
Limitation of object value (min) in ppm	0…5000
Limitation of object value (max) in ppm	0…5000; 2000
Type of threshold value change	Absolute value • Increase/Decrease
Increment in ppm *(upon increase/decrease change)*	1 • 2 • 5 • 10 • 20 • … • 200

Set the **switching distance** independent of the type of threshold value specification.

Switching distance in % of the threshold value	0 … 50; 20

Switching output

Set the behaviour of the switching output when a threshold value is exceeded/under-cut. The output switching delay can be set using objects or directly as a parameter.

When the following conditions apply, the output is (TV = Threshold value) (SD = Switching distance)	• <u>TV above = 1 | TV - SD below = 0</u> • LV above = 0 | TV - SD below = 1 • TV below = 1 |TV + SD above = 0 • TV below = 0 |TV + SD above = 1
Delays can be set via objects (in seconds)	<u>No</u> • Yes
Switching delay from 0 to 1 *(If delay can be set via objects: valid until first communication)*	<u>None</u> • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching delay from 1 to 0 *(If delay can be set via objects: valid until first communication)*	<u>None</u> • 1 s • 2 s • 5 s • 10 s • ... • 2 h
Switching output sends	• <u>on change</u> • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Cycle *(is only sent if periodically is selected)*	<u>5 s</u> • 10 s • 30 s... • 2 h

Block

The switching output can be blocked using an object.

Use switching output block	<u>No</u> • Yes

If the block is activated, define specifications here for the behaviour of the output when blocked.

Analysis of the blocking object	• <u>At value 1: block | At value 0: release</u> • At value 0: block | At value 1: release
Blocking object value before first communication	<u>0</u> • 1
Behaviour of the switching output	
On block	• <u>Do not send message</u> • send 0 • send 1
On release (with 2 seconds release delay)	[Dependent on the "Switching output sends" setting]

The behaviour of the switching output on release is dependent on the value of the parameter "Switching output sends" (see "Switching output")

Switching output sends on change	• Do not send message • Send switching output status

Switching output sends on change to 1	• Do not send message • if switching output = 1 ➔ send 1
Switching output sends on change to 0	• Do not send message • if switching output = 0 ➔ send 0
Switching output sends on change and periodically	Send switching output status
Switching output sends on change to 1 and periodically	if switching output = 1 ➔ send 1
Switching output sends on change to 0 and periodically	if switching output = 0 ➔ send 0

6.14. VOC PI-control

If you activate air quality control, you can use the following settings to define control type, setpoint values, and ventilation.

Use control	**Yes** • <u>No</u>

General control

The **Sensor KNX VOC/TH-UP Touch** can be used to control one or two-stage ventilation.

Type of control	• <u>One-stage ventilation</u> • Two-stage ventilation

Configure a block for the ventilation control using the blocking object.

Behaviour of the blocking object with value	• <u>1 = block control	0 = release control</u> • 0 = block control	1 = release control
Blocking object value before first communication	0 • <u>1</u>

Specify when the current control variables are to be sent to the bus. Periodic sending is safer, in case a message does not reach a recipient. You may also set up periodic monitoring using an actuator with this setting.

Send control variable	• <u>on change</u> • on change and periodically
at and above change of (in ppm)	1...20; <u>2</u>
Cycle (*if sent periodically*)	5 s • ... • <u>5 min</u> • ... • 2 h

The status object shows the current status of the output variable (0 = OFF, >0 = ON) and can for example be used for visualisation.

Send status object(s)	• on change • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Cycle (*if sent periodically*)	5 s • 10 s • ... • 2 h

Controller setpoint

The setpoint values can be set directly in the application program using parameters, or be defined via the bus using a communication object.

Setpoint value setting using parameters:

Set the setpoint value directly.

Specified setpoint using	**Parameter** • Communication objects
Target value in ppm	300…5000; 800

Setpoint value setting via communication object:

Enter, how the setpoint value will be received from the bus. Basically, a new value can be received, or simply a command to increase or decrease.

During initial commissioning, a setpoint value must be defined which is valid until the first communication of a new setpoint value. For units which have already been taken into service, the last communicated setpoint value can be used. Basically, an air humidity range is given in which the setpoint value can be changed (object value limit).

A set setpoint value will be retained until a new value or a change is transferred. The current value is saved, so that it is retained in the event of a power supply failure and will be available once the power supply is restored.

Threshold value setting using	Parameter • **Communication objects**
The last communicated value should be retained	• never • after power supply restoration • after power supply restoration and programming
Start setpoint value in ppm valid until first communication *(not upon saving the setpoint value after programming)*	300… 5000; 800
Object value limit (min) in ppm	300…5000; 400
Object value limit (max) in ppm	300…5000; 1500
Type of threshold value change	Absolute value • Increase/decrease
Increment in ppm *(upon increase/decrease change)*	1 • 2 • 5 • ... • 20 • ... • 100 • 200

Ventilation control

Depending on the control mode, one and/or two setting sections for the ventilation stages are displayed.

For two-stage ventilation, the setpoint value difference between the two stages must be defined, i.e. the setpoint value which, when exceeded, triggers the switch to the 2nd level.

Target value difference between 1st and 2nd level in ppm *(for level 2 only)*	100...2000; 400

Determine the deviation from the setpoint value at which the maximum variable value is reached, i.e. the point at which maximum output is used.
The reset time shows how quickly the controller responds to deviations from the setpoint value. In case of a short reset time, the control responds with a fast increase of the control variable. In case of a long reset time, the control responds somewhat less urgently and needs longer until the necessary control variable for the setpoint value deviation is reached.
You should set the time appropriate to the ventilation system at this point (follow the manufacturer's instructions).

Maximum control variable is reached at setpoint value/actual difference of (in ppm)	100...2000
Reset time in minutes 1st level Reset time in minutes 2nd level	1...255; 30 1...255; 10

Now specify what should be sent when the control is blocked.
On release, the control variable follows the rule again.

When blocked, the control variable shall	• not send anything • send a value
Value in % (*if a value is sent*)	0...100

6.15. Variable comparator

The two integrated control variable comparators can output maximum, minimum and median values.

Use comparator 1/2	No • Yes

6.15.1. Control variable comparator 1/2

Determine what the control variable comparator should output, and activate the input objects to be used. Send behaviour and blocks can also be set.

Output delivered	• Maximum value • Minimum value • <u>Average value</u>
Use input 1/2/3/4/5	No • Yes
Output sends	• <u>on change of output</u> • on change of output and periodically • when receiving an input object • when receiving an input object and periodically
From change of *(is only sent if "on change" is selected)*	<u>1%</u> • 2% • 5% • 10% • 20% • 25%
Send cycle *(is only sent if "periodically" is selected)*	5 s • 10 s • 30 s • ... • <u>5 min</u> • ... • 2 h
Analysis of the blocking object	• <u>at value 1: block	at value 0: release</u> • at value 0: block	at value 1: release
Blocking object value before 1st communication	0 • 1
Behaviour of the switching output	
With blocking	• <u>do not send message</u> • Send value
Sent value in %	0 ... 100

6.16. Logic

The device has 16 logic inputs, four AND- and four OR-logic gates.

Activate the logic inputs and assign object values up to 1st communication. Then, activate the required logic outputs.

Use logic inputs	Yes • <u>No</u>
Object value before 1st communication for	
- Logic input 1	<u>0</u> • 1
- Logic input ...	<u>0</u> • 1
- Logic input 16	<u>0</u> • 1

Activate the required logic outputs.

AND logic

AND logic 1	<u>not active</u> • active
AND logic ...	<u>not active</u> • active
AND logic 4	<u>not active</u> • active

OR logic

OR logic 1	<u>not active</u> • active
OR logic ...	<u>not active</u> • active

OR logic 4	not active • active

6.16.1. AND logic 1-4 and OR logic outputs 1-4

The same setting options are available for AND and OR logic.

Each logic output may transmit one 1 bit or two 8 bit objects. Determine what the out put should send if logic = 1 and = 0.

1. / 2. / 3. / 4. Input	• do not use - Logic inputs 1...16 - Logic inputs 1...16 inverted • all switching events that the device provides (see *Connection inputs of the AND/OR logic*)
Output type	• a 1-Bit-object • two 8-bit objects

If the **output type is a 1-bit object**, set the output values for the various conditions.

Output value if logic = 1	1 • 0
Output value if logic = 0	1 • 0

If the **output type is two 8-bit objects**, set the type of object and the output values for the various conditions.

Object type	• Value (0…255) • Percent (0…100%) • Angle (0…360°) • Scene call-up (0…127)
Output value object A if logic = 1	0 … 255 / 100% / 360° / 127; 1
Output value object B if logic = 1	0 … 255 / 100% / 360° / 127; 1
Output value object A if logic = 0	0 … 255 / 100% / 360° / 127; 0
Output value object B if logic = 0	0 … 255 / 100% / 360° / 127; 0

Set the output send pattern.

Send pattern	• <u>on change of logic</u> • on change of logic to 1 • on change of logic to 0 • on change of logic and periodically • on change of logic to 1 and periodically • on change of logic to 0 and periodically • on change of logic+object receipt • on change of logic+object receipt and periodically
Send cycle *(if sent periodically)*	5 s • <u>10 s</u> • ... • 2 h

Block

If necessary, activate the block for the logic output and set what a 1 or 0 at the block input means and what happens in the event of a block.

Analysis of the blocking object	• <u>At value 1: block | At value 0: release</u> • At value 0: block | At value 1: release
Blocking object value before first call	<u>0</u> • 1
Behaviour of switching output	
On block	• <u>Do not send message</u> • Transmit block value [see above, Output value if blocking active]
On release (with 2 seconds release delay)	[send value for current logic status]

6.16.2. Connection inputs of the AND logic

6.16.3. Connection inputs of the OR logic

The OR logic connection inputs correspond to those of the AND logic. In addition the following inputs are available for the OR logic:

AND logic 1
AND logic output 1 inverted
AND logic output 2
AND logic output 2 inverted
AND logic output 3
AND logic output 3 inverted
AND logic output 4
AND logic output 4 inverted

6.17.   Display

Adjust the display settings here.

Use display lighting	<u>No</u> • **Yes**
Brightness in % up to 1. Communication	0 ... 255; <u>100</u>
Lighting	<u>always on</u> • only when operating

Switch off delay after operation until 1st communication (in seconds)	1 ... 600; 10
Saving brightness and switch off delay	• never • after power restoration • after power restoration and programming

Set contrast and number of lines, as well as the type of temperature target value display.

Use object "display contrast"	No • Yes
Display mode	• two lines (with optional thermostat display) • three lines (with optional thermostat display) • Permanent thermostat
Temperature controller display when using pushbutton	No • **Yes**
only possible if the pushbuttons are also set to "For temperature control")	
Type of temperature target value display *(only for active thermostat display)*	• Current target value • Basic setpoint • Basic setpoint as bar chart • Basic setpoint as bar chart with count • Basic setpoint as bar chart with range Basic setpoint as bar chart with range and count
Display duration in seconds for Temperature controller display	2...240; 5

Choose if you would like to use the return release.

Use object "Return approval"	No • **Yes**
Object evaluation	• 1= Allow return | 0=Return not allowed • 1= Allow return | 0=Return not allowed
Object value prior to initial communication	0 • 1

Choose if input objects should be used.

Use input objects	No • Yes

Set what should appear on the display.

Content line 1 (small font size)	• display nothing • internal temperature • other selection options

Content line 2 (large font size)	• display nothing • VOC internal reading • other selection options

Content line 3 (small font size)	• display nothing • relative humidity internal • other selection options

The following table contains a list of other selection options.

List with other selection options:

External temperature Total temperature Current thermostat target value Dew point temperature relative humidity external relative humidity total absolute humidity g/kg absolute humidity g/m^3 VOC external reading VOC total reading Date (Not for line 2!) Time	
8-bit object value 1 8-bit object value 2 8-bit object value 3	• without [0 ... 255] • percentage [0% ... 100%] • degree [0° ... 360°]

16-bit object value 1 16-bit object value 2 (Not for line 2!)	• <u>without</u> • °C (degree Celsius) • lux • m/s (metres per second) • Pa (Pascal) • bar • mbar (millibar) • % R.H. (% relative humidity) • ppm (parts per million) • s (second) • ms (millisecond) • v (volt) • mV (millivolt) • A (ampere) • mA (milliampere) • W (watt) • mW (milliwatt) • W/m^2 (watt per square meter) • W/h (watt per hour) • ltr (litre) • ltr/h (litre per hour) • m (meter) • mm (millimetre)
Text message 1 Text message 2 (Not for line 2!)	Display duration of the message: • <u>until new notification available</u> • max. 1 minute • ... • max. 60 minutes

6.18.   Pushbutton

Adjust the pushbutton settings here.

6.18.1. Pushbutton for temperature control

Use pushbutton	• as button interface • <u>for temperature control</u>
Pushbutton functions	Left button (short) --> target temperature down Right button (short) --> target temperature up Left button (longer than 2 sec) --> mode switch Right button (longer than 2 sec) --> mode switch If both buttons are pressed in eco mode for more than 2 seconds, comfort mode is activated for the set duration.
The following modes can be selected by pushbutton:	
Comfort	No • <u>Yes</u>
Standby	No • <u>Yes</u>
Eco	No • <u>Yes</u>
Building protection	<u>No</u> • Yes

6.18.2. Pushbutton interface

Choose if you would like to use the button as a button interface, and set the function.

Use pushbutton interface	<u>No</u> • Yes
Function	• <u>Switch</u> • Changeover switch • Shutter • Roller blind • Awning • Window • Dimmer • 8-bit encoder • 16-bit encoder • Scenario recall

Define which values are sent when the button is pressed/released, and when these are sent.

Command when pressing the pushbutton	• send 0 • send 1 • <u>do not send message</u>
Command when releasing the pushbutton	• send 0 • send 1 • <u>do not send message</u>

Send value	• <u>on change</u> • on change to 1 • on change to 0 • on change and periodically • on change to 1 and periodically • on change to 0 and periodically
Cycle (*if sent periodically*)	5 s • ... • <u>1 min</u> • ... • 2 h

Changeover switching

Command when pressing the pushbutton	• Changeover switching • <u>do not send message</u>
Command when releasing the pushbutton	• Changeover switching • <u>do not send message</u>

Blind

Pushbutton function	• <u>Up</u> • Down
Control mode	• <u>Standard</u> • Standard inverted • Comfort mode • Dead man's switch

Standard:

Behaviour for button actuation (up): short = Stop/Step | long = Up Behaviour for button actuation (down): short = Stop/Step | long = Down	
Time between short and long in 0.1 seconds	0 ... 50; <u>10</u>

Standard inverted:

Behaviour for button actuation (up): long = Stop/Step | short = Up Behaviour for button actuation (down): short = Stop/Step | long = Down	
Time between short and long in 0.1 seconds	0 ... 50; <u>10</u>
Repeat the step command for a long button press	every 0.1 s • every 2 sec; <u>every 0.5 sec</u>

Comfort mode:

Button is pushed and	
released before time 1 expired held longer than time 1 released between time 1 and 1-2 released after time 1 +2	stop/step Up or Down Stop no more stop
Time 1 (in 0,1 s)	0 ... 50; <u>4</u>
Time 2 (in 0,1 s)	0 ... 50; <u>20</u>

Dead man's switch:

Push button	down command
Release button	up command

Shutter

Pushbutton function	• Up • Down • Up/Down
Control mode	• Standard • Standard inverted • Comfort mode • Dead man's switch

Standard:

Behaviour for button actuation (up): short = Stop | long = Up Behaviour for button actuation (down): short = Stop | long = Down Behaviour in case of button actuation (up/down): short = Stop | long = Up/Down	
Time between short and long in 0.1 seconds	0 ... 50; 10

Standard inverted

Behaviour for button actuation (up): long = Stop | short = Up Behaviour for button actuation (down): short = Stop | long = Down Behaviour in case of button actuation (up/down): short = Stop | long = Up/Down	
Time between short and long in 0.1 seconds	0 ... 50; 10
Repeat the step command for a long button press (only Up)	no • every 0,1 s • ... • every 0,5 s • ... • every 2 s

Comfort mode:

Button is pushed and	
released before time 1 expired held longer than time 1 released between time 1 and 1-2 released after time 1 +2	Stopp Up | Down | Up/Down Stop no more stop
Time 1 (in 0,1 s)	0 ... 50; 4
Time 2 (in 0,1 s)	0 ... 50; 20

Dead man's switch:

Push button	Up- | Down- | Up/Down command
Release button	Stop command

Awning

Pushbutton function	• Retract • Extend • Retract/Extend
Control mode	• Standard • Standard inverted • Comfort mode • Dead man's switch

Standard:

Behaviour in case of button actuation (retract): short = Stop | long = Retract Behaviour in case of button actuation (extend): short = Stop | long = Extend Behaviour in case of button actuation (retract/extend): short = Stop | long = Retract/Extend	
Time between short and long in 0.1 seconds	0 ... 50; 10

Standard inverted:

Behaviour in case of button actuation (retract): long = Stop | short = Retract Behaviour in case of button actuation (extend): long = Stop | short = Extend Behaviour in case of button actuation (retract/extend): long = Stop | short = Retract/Extend	
Time between short and long in 0.1 seconds	0 ... 50; 10
Repeat the step command for a long button press (only Up)	no • every 0,1 s • ... • every 0,5 s • ... • every 2 s

Comfort mode:

Button is pushed and	
released before time 1 expired held longer than time 1 released between time 1 and 1-2 released after time 1 +2	Stop On | Off | On/Off Stop no more stop
Time 1 (in 0,1 s)	0 ... 50; 4
Time 2 (in 0,1 s)	0 ... 50; 20

Dead man's switch:

Push button	On- | Off- | On/Off command
Release button	Stop command

Window

Pushbutton function	• <u>Close</u> • Open • Open/Close
Control mode	• <u>Standard</u> • Standard inverted • Comfort mode • Dead man's switch

Standard:

Behaviour in case of button actuation (close): short = Stop | long = Close Behaviour for button actuation (up): short = Stop | long = Up Behaviour in case of button actuation (open/close): short = Stop | long = Open/Close	
Time between short and long in 0.1 seconds	0 ... 50; <u>10</u>

Standard inverted:

Behaviour in case of button actuation (close): long = Stop | short = Close Behaviour for button actuation (up): long = Stop | short = Up Behaviour in case of button actuation (open/close) long = Stop | short = Open/Close	
Time between short and long in 0.1 seconds	0 ... 50; <u>10</u>
Repeat the step command for a long button press (only Up)	no • every 0,1 s • ... • <u>every 0,5 s</u> • ... • every 2 s

Comfort mode:

Button is pushed and	
released before time 1 expired held longer than time 1 released between time 1 and 1-2 released after time 1 +2	stop/step Up or Down Stop no more stop
Time 1 (in 0,1 s)	0 ... 50; <u>4</u>
Time 2 (in 0,1 s)	0 ... 50; <u>20</u>

Dead man's switch:

Push button	Close- | Up- | Open/Close command
Release button	Stop command

Dimmer

Pushbutton function	• <u>Brighter</u> • darker • Brighter/darker
Time between switching and dimming in 0.1 seconds	0 ... 50; 5
Repetition of the dimming command	<u>No</u> • **Yes**
Repetition of the dimming command upon extended button actuation	every 0,1 s • ... • <u>every 0,5 s</u> • ... • every 2 s
Dimming by	100% • ... • <u>6%</u> • ... • 1,5%

8 bit encoder

Value range	• <u>0 ... 255</u> • 0% ... 100% • 0° ... 360°
Value	• <u>0</u>... 255 • <u>0</u> ... 100 • <u>0°</u>... 360°

16 bit encoder:

Value in 0.1	-6707600 ... 6707600; <u>0</u>

Scenario control:

Scenario no.	<u>0</u> ... 127

Questions about the product?

You can reach the technical service of Elsner Elektronik under **Tel. +49 (0) 70 33 / 30 945-250** or **service@elsner-elektronik.de**

We need the following information to process your service request:

- Type of appliance (model name or item number)
- Description of the problem
- Serial number or software version
- Source of supply (dealer/installer who bought the device from Elsner Elektronik)

For questions about KNX functions:

- Version of the device application
- ETS version used for the project
